

Modeling the Process

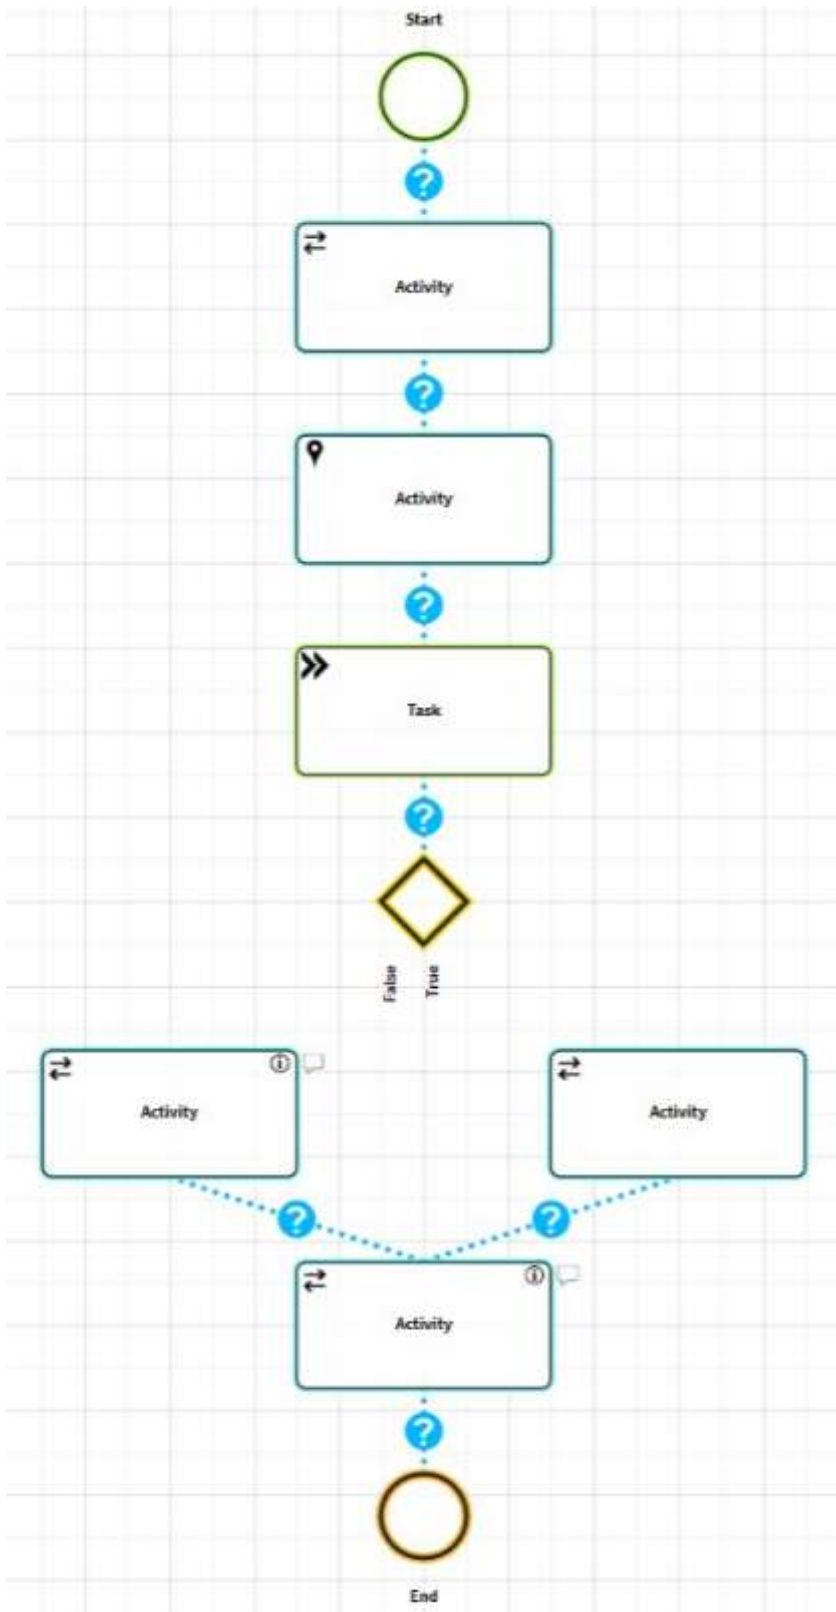

First, you will model the process that we'll later automate. In this section, you will also learn how to add a role - and therefore a user - to the workflow. This user will be the person who gets the assigned tasks later in the workflow.

Select the PROCESS designer and create a new model by clicking **New Model** in the top ribbon menu **Main**. A new model is created.

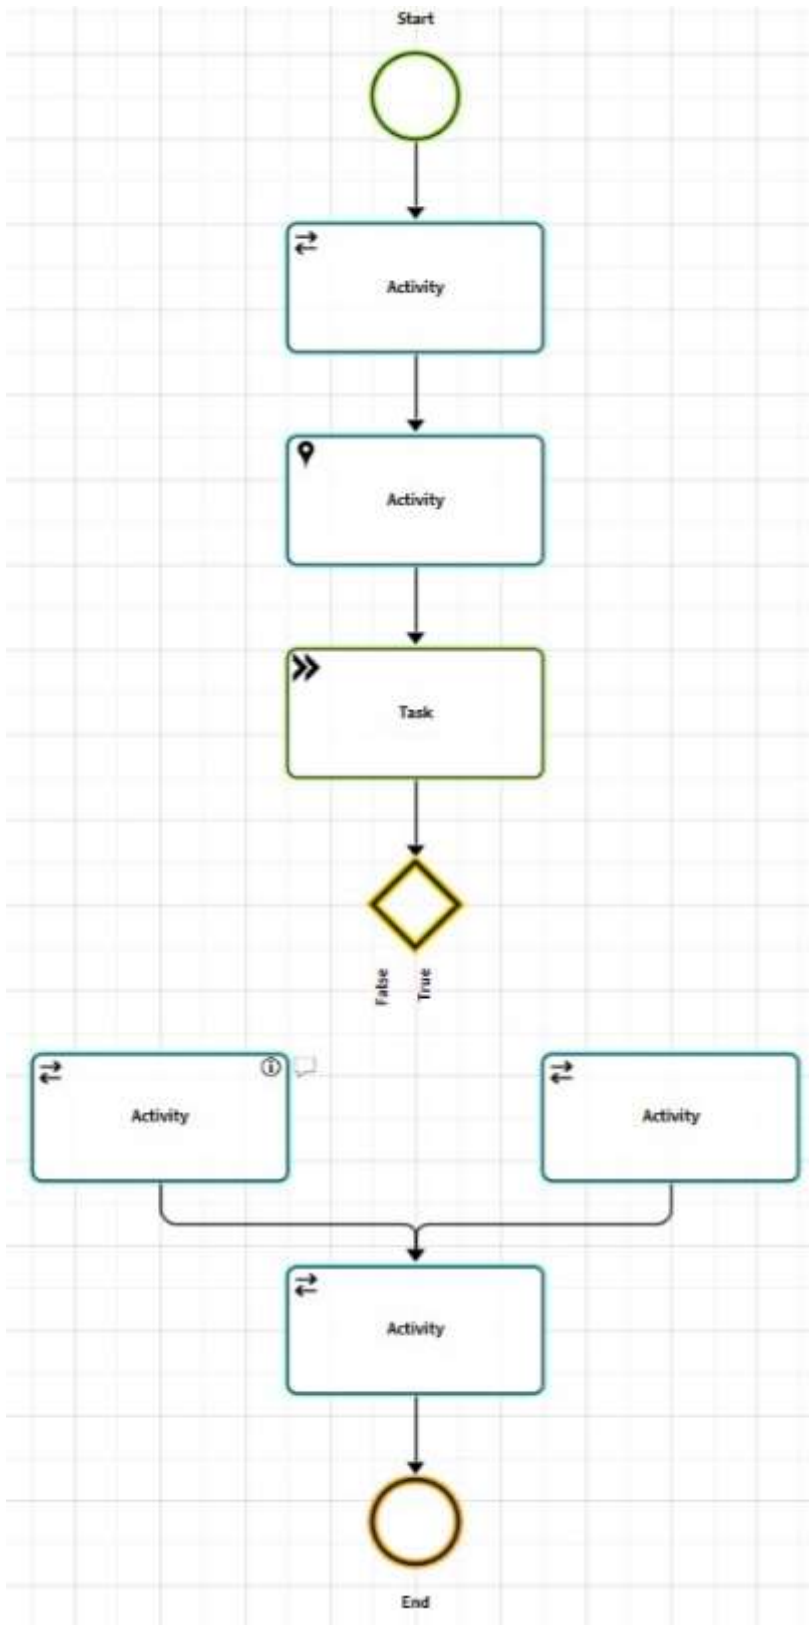

In the left notation element repository, collapse the section **Advanced**, expand the sections **Miscellaneous** and **WebService** and drag & drop these elements on the canvas in the following order:

- Start
- Assign value (Miscellaneous)
- BING distance (WebService)
- Task
- Condition
- Assign value (left path of condition) (Miscellaneous)
- Assign value (right path of condition) (Miscellaneous)
- Assign value (Miscellaneous)
- End

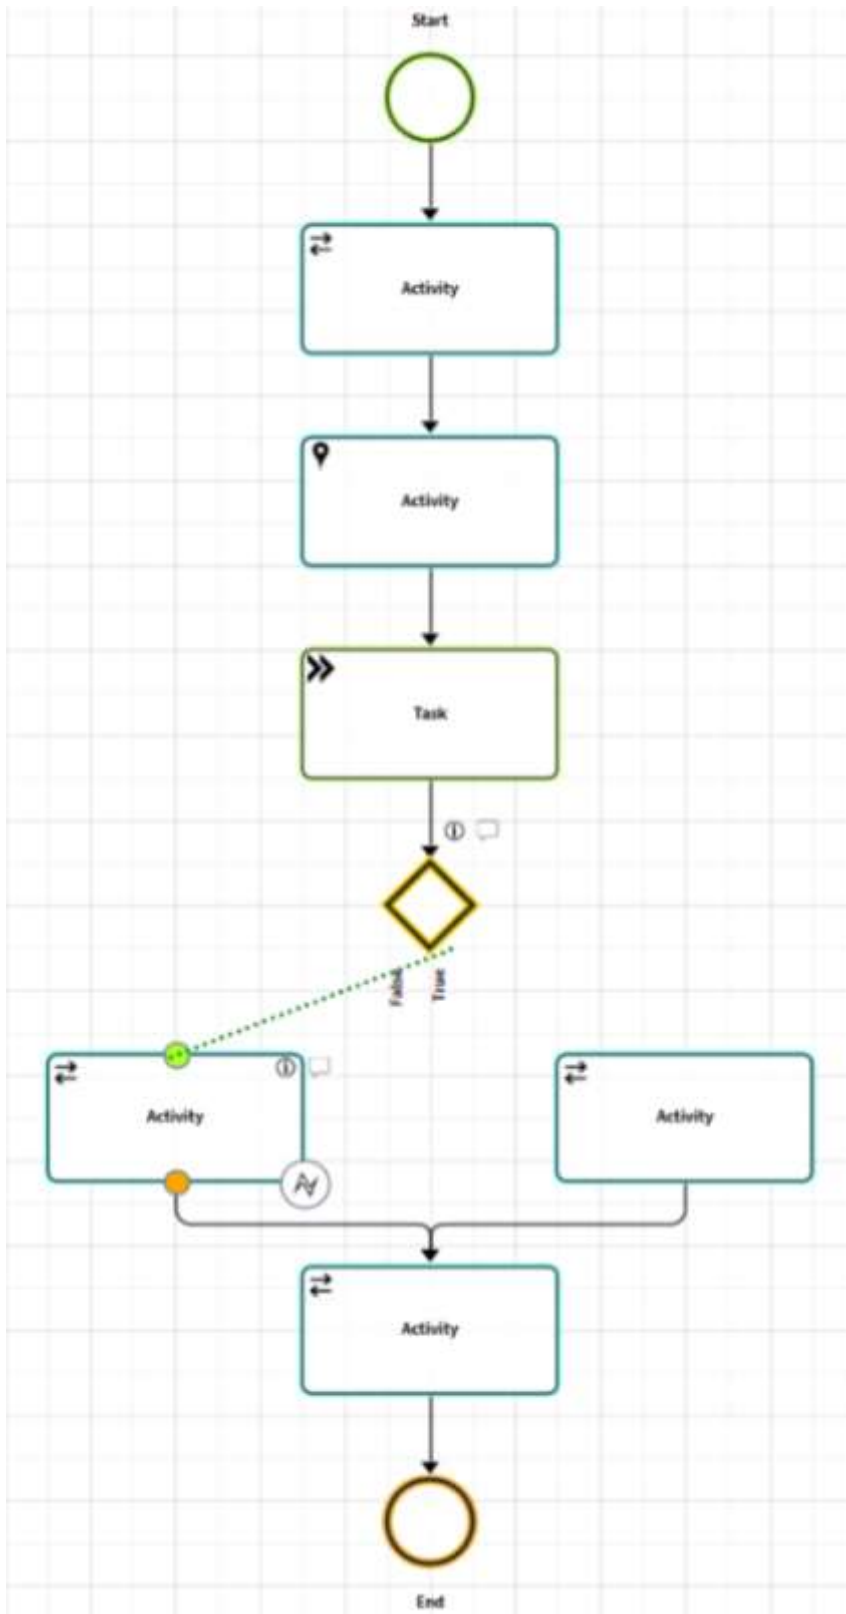

Open **Actions** and click **Connect all** from the top ribbon menu **Main** or click the **Connect all** button above the notation element repository.

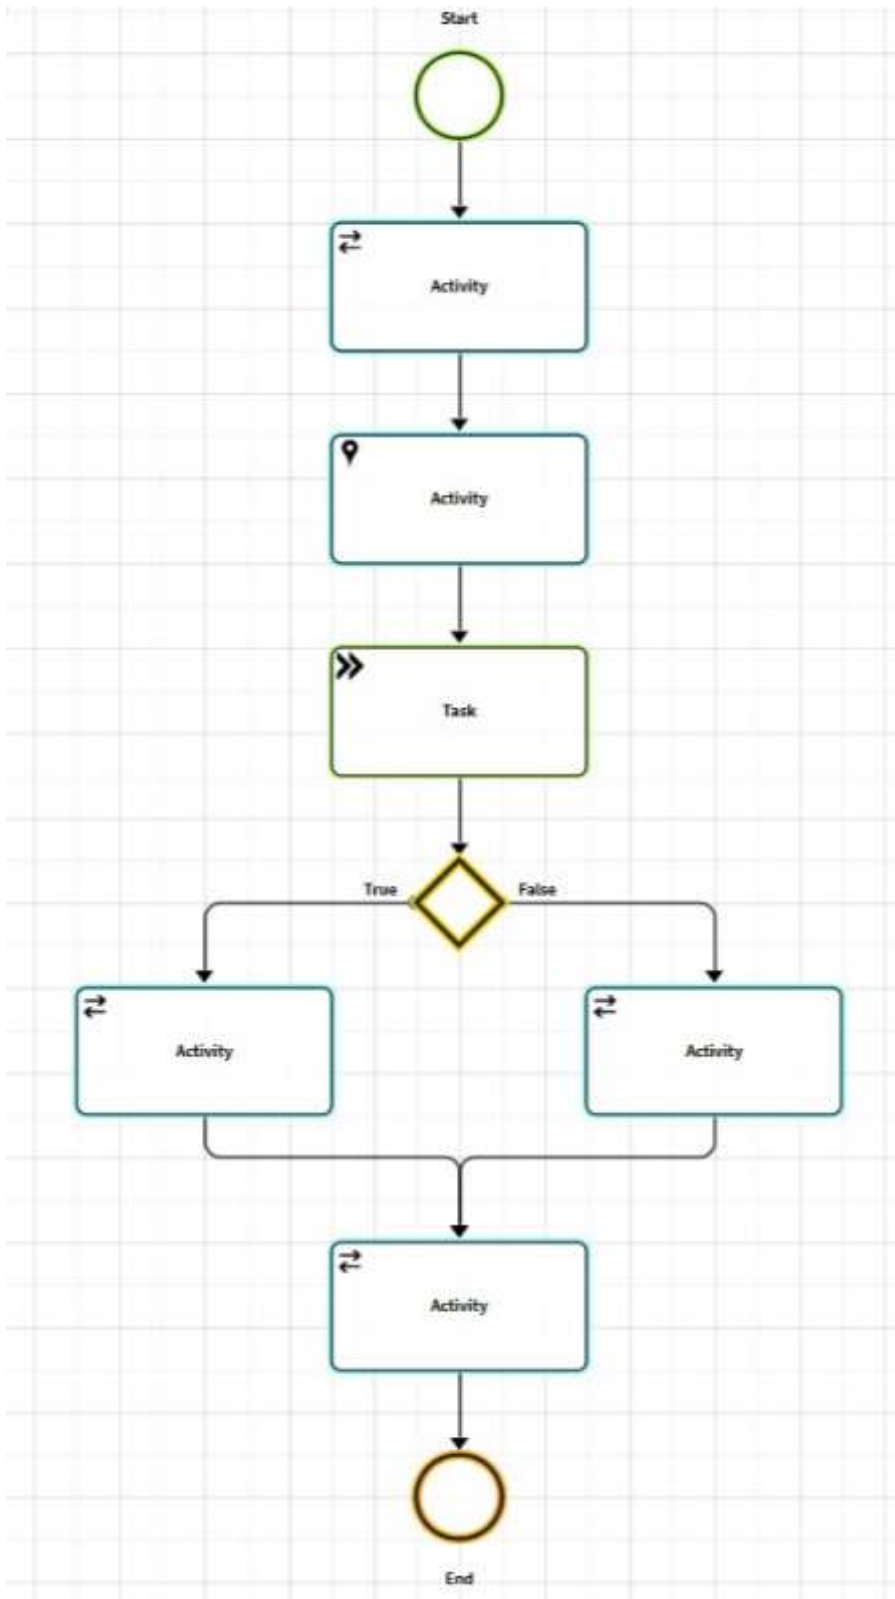

All proposed lines become solid. Lines between conditions and succeeding elements have to be drawn manually.

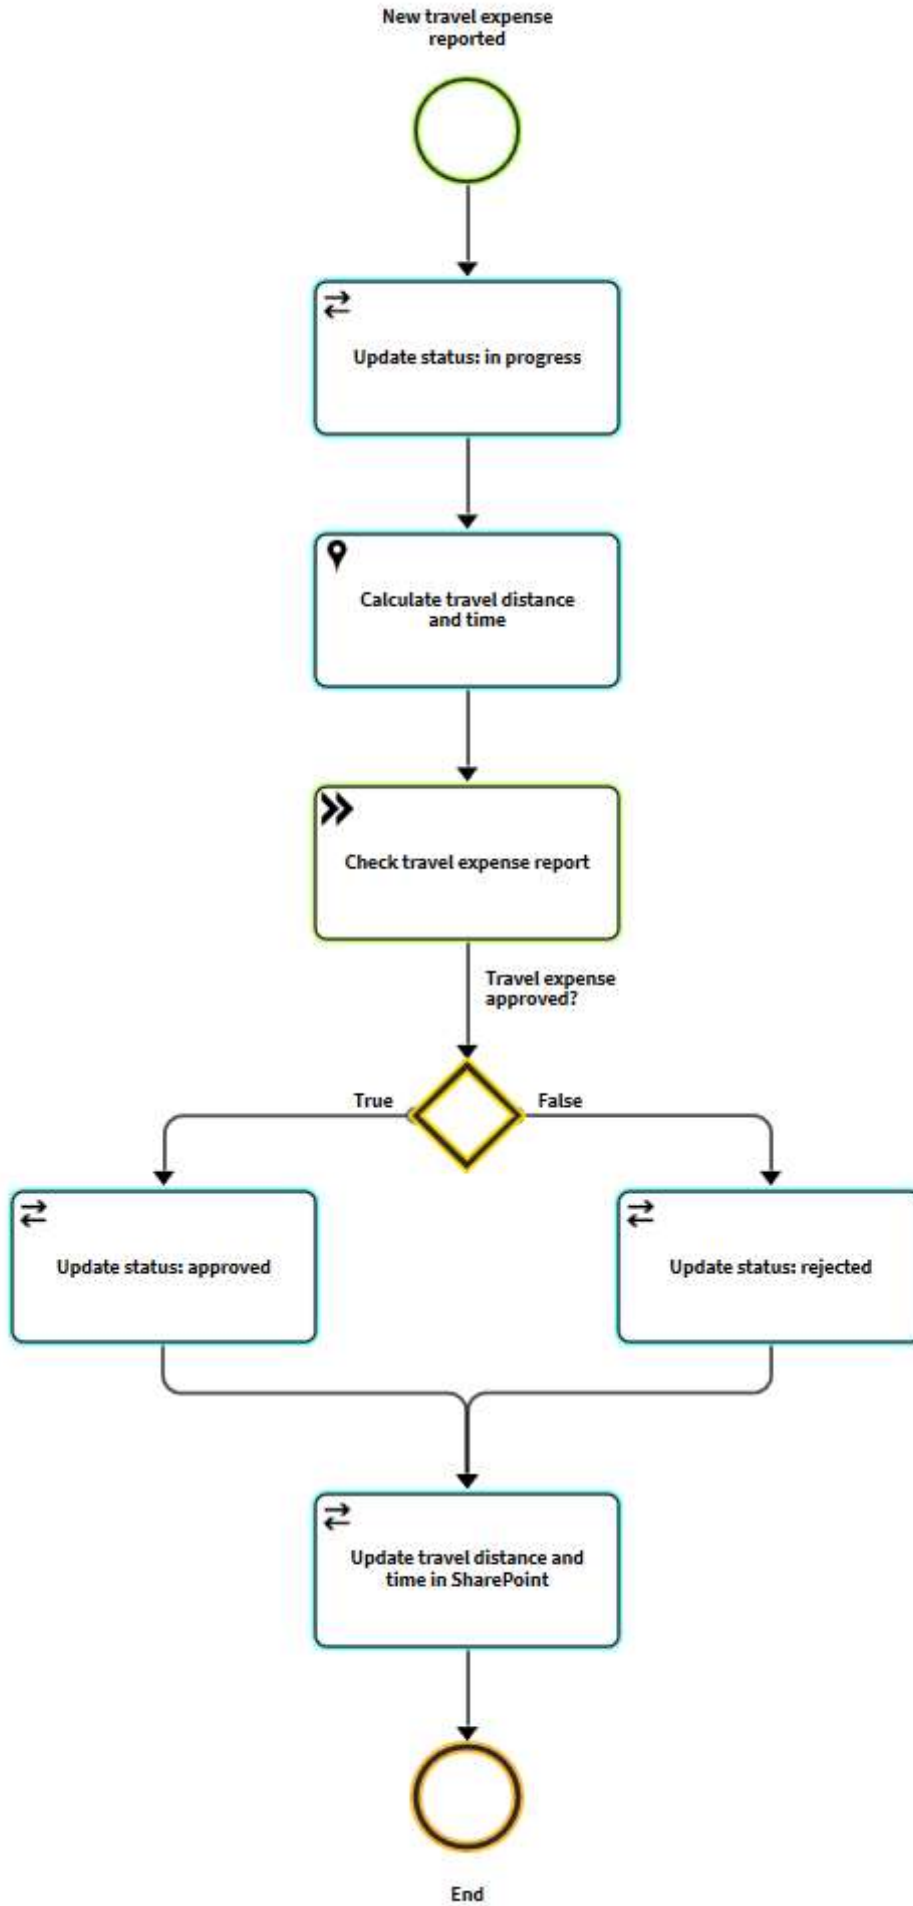

Click and hold a condition exit tie point (orange/true and white with flash/false) and drag a line to the corresponding entry tie point (green) on the succeeding elements.

Here, both paths have been connected to the succeeding elements.

Now double-click each element and name them accordingly:

Workflow variables are used to store calculation results or decisions temporarily. Click **Edit Workflow Variables** in the top ribbon menu **Main**.

Add three fields by clicking the **Add field** button.

Field name – Field type

- Distance – Text
- Time – Text
- Decision – Boolean

Name them and change the type of the field **Decision** from text to **Boolean**.

Business entity definition

Here you can define the fields of this business entity which can be mapped with real data. Fields which are not mapped are workflow variables. Additionally, you can define views for complex data structures.

✖

General / Fields

Name:

Description:

Fields: Show configuration: Live ▼ Teste Daten

	Name	Type	Default value	Required	Read-only
All:					
	Decision	Boolean ▼		<input type="checkbox"/>	<input type="checkbox"/>
	Distance	Text ▼		<input type="checkbox"/>	<input type="checkbox"/>
	Time	Text ▼		<input type="checkbox"/>	<input type="checkbox"/>

 **Add field**
 **Remove field**
 Show system fields
 **OK**
 **Cancel**

Click **OK** to close.

In the top ribbon menu **Main**, click **Save**.

Select a scope from the navigation, give the process model a name and click **Save**.
