Workflow Execution Log

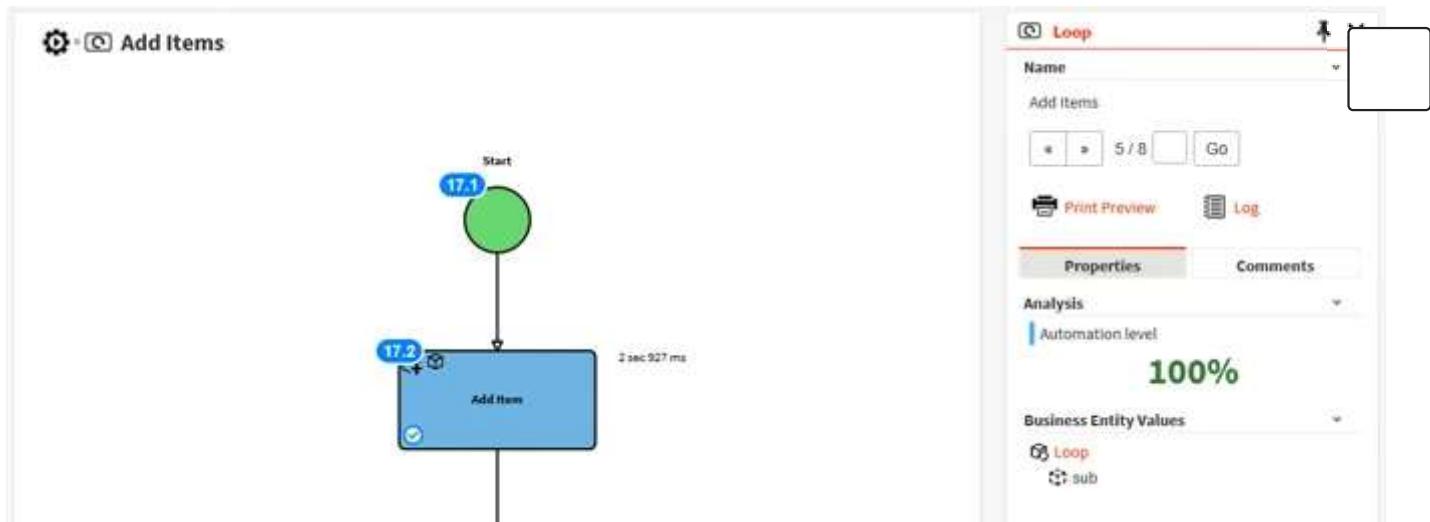

The workflow execution log stores all relevant information about a workflow execution, including all time stamps, when which action has been performed, and which value has been assigned to which variable. As this information might be confidential, only members of the admin group and the workflow responsible person can access this log.

Log					
		Element	Action	Information	User
	2019-11-29 11:28:18	17 Add Items	Loop		
	2019-11-29 11:28:38	17.1 Add Items Start [5]	Start:	Add Items	
	2019-11-29 11:28:38	17.1 Add Items Start [5]	State	Complete

The execution log is showing the element numbers, which can also be displayed in the process and workflow view. Therefore, the corresponding log section to one element can be found quickly.

The execution log is a powerful tool for checking and debugging workflow executions. The execution log can be exported to PDF or Excel files within the execution log window, or, with the "Execution Log" activity, it can be exported automatically within process.

The FireStart Client uses the same powerful implementation of the Execution Log as the ProcessPortal.

The screenshot shows the FireStart Client interface. On the left, the "Workflow" designer is open, displaying a workflow with a start node, an "Add Item" activity, and an end node. On the right, the "Execution View" window is open, showing the history of the workflow's execution. The execution log table lists 40 entries, each detailing a step (e.g., "Loop", "Add Item") with its timestamp (e.g., 2020-02-08 17:23:34), action (e.g., "Start", "Complete"), and status (e.g., "Running", "Completed"). A "Mappings" section provides detailed information about the data items involved in the steps.
