< Back to home
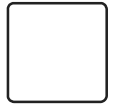

Create a Domain Model

With domain is meant a product group or cost centers.

Open the **Domains** designer from the navigation pane.

Create a new domain model by clicking **New Model** from the ribbon menu **Main**. In the property pane, give the model a name.

With drag & drop, you can place a domain element from the element repository onto the canvas. It is possible to rename the domain by double-clicking the domain element. For the domains, you can also add groups, e.g., for different products, etc.

Click **Save** from the ribbon menu **Main**.

In the save-dialog select a scope (or create a new one) and click **Save**.
