Create a Risk Model

Open the **Risk** designer from the navigation pane.

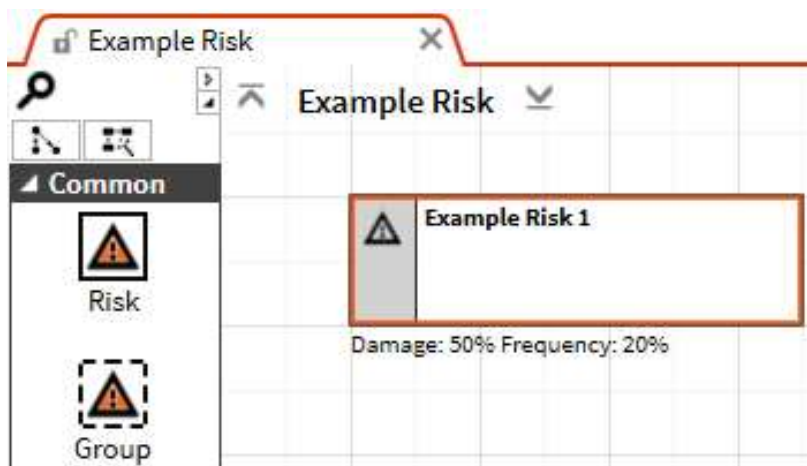

To create a new risk model, click **New Model** in the ribbon menu **Main**.

In the property pane, you can give the model a name. The risk designer is a bit special as you can add **Damage** and **Frequency** to a risk element. To do that, you simply have to modify the **Risk** section of a selected risk element in the **Property Pane**.

Drag & drop a risk element from the element repository onto the canvas in order to add a new risk. You can rename the risk element by double-clicking it. For the risk model you can also add groups, e.g., for different issues, etc.

Click **Save** from the ribbon menu **Main**.

In the save-dialog select a scope (or create a new one) and click **Save**.
