# Credential Manager

The **Credential Manager** is a new system introduced that allows the central storage of credentials for simpler maintenance and re-usability.

Each Credential consists of the following basic properties (see the screenshot below):

- **Name:** A unique name to identify the Credential
- **Description:** Further information that e.g. describes the purpose or usage of the Credential
- **Open For:** Can be either set to public or private
  - **Public:** The Credential is available for all users of FireStart
  - **Private:** The Credential is only available to the creator.

The existence of the Credential is visible to the administrator.

- **Type:** The type of the Credential, divided in
  - Basic
  - Mail
  - Token
  - Certificate

The **Set data** section defines the information that is required to store a Credential of a given type. If all necessary data is supplied, the Credential can be stored by clicking the **Save** button.
