Add Portals and Update Versions

The Portals page, found under **Menu > preferences > Plugins > Portals**, lists all the defined Portals and provides options to **Add** or **Update new versions**.

The list below the options shows which Portal binding belongs to which Portal.

The groups are collapsed by clicking on the group header.

A Portal binding consists of a connection status (**online/offline/testing**), the binding name, the binding path and the options to search for usages and to delete such a Portal binding. You can only delete a Portal binding if it is not currently in use.

You can check where a Portal binding is used by clicking the **Search usages** button. By double clicking such a usage, the Model that uses the binding will be opened.

Miscellaneous

- The portal assembly to add must be in .dll format. Otherwise an **error message** will be shown.
- When you try to update an existing Portal to a newer version, you will encounter an **error message** if the version is the same or older than the one currently installed.
- An **error message** is also shown if a wrong portal is selected.
