# Export to Word

FireStart lets you export your process model to a Word document. This can be useful if you want to print your process model. The export process is quite simple. Just open the process you want to export, open the **Publish** tab, go the **Import/Export** section, and click the **Word** icon.

In the open dialog, the **Word Document** can be customized. It can be selected which parts of the process should be exported and displayed. In order to save the document, a path is required. The path of the folder to save the file can be entered on top of the dialog.

After finishing the configuration click **OK** and the folder you chose to save the file in, will open.

If no path is entered, the **Word Document** opens when clicking **OK**, which means it is not saved anywhere by then, but it still can be saved directly in the **Save As** dialog in Word.

As it is a **Word Document**, the content can be modified at any time.
