Fast Modeling

In addition to adding elements from the InsertPanel or ContextMenu, you can now simply drag the Mouse from an output point of an element to the canvas, like when drawing a line, and insert an element from the selection window. This will allow you to create models very fast and intuitively.

Step 1: Start dragging from an element end point.

Step 2: Releasing the mouse button - it will open a selection window.

Step 3a: Selecting an element by clicking on it. It will be inserted at the chosen location and automatically connected to the end point selected in step 1.

Step 3b: Clicking on the canvas without selecting an element will close the window without adding an element.
